Many areas of industry are implementing stricter standards of cleanliness and hygiene to combat the proliferation of viruses and bacteria like the new A (H1N1) virus. The transport, catering and food and drink industries, for example, are among those affected. Operatives in these industries need to observe simple but effective precautions on a daily basis to prevent, or at least limit the proliferation of the organisms that provoke infections and complications, including serious diseases like influenza. These precautions include frequent hand washing with soap and water or, if soap and water are not available, with alcohol-based detergents or sanitising solutions.

IPC Euromop, a member of the IPC Group – the leading Italian manufacturer of professional sanitisation solutions – is well aware of the importance of proper cleaning and sanitising in public spaces, and has developed IPC Cleaning Point specifically to provide an important service and a valid solution to the hygiene needs of public places and persons on the move.

The IPC Group

IPC Euromop is a member of the IPC Group, the leading Italian manufacturer of professional cleaning systems and equipment. The IPC group of companies offers a complete range of systems, products and services covering all possible cleaning and sanitising needs.

Well aware of the importance of proper cleanliness and hygiene in controlling pathogens in public places and high traffic environments, IPC Euromop has developed a special sanitisation system comprising an antibacterial plastic dispenser and a bactericidal, dermatologically protective gel to satisfy the sanitisation needs of all public spaces.

The IPC Cleaning Point

The IPC Cleaning Point is a hand cleaning station designed for easy access in all places used by large numbers of the public, where soap and water are not readily available.

With its HDS dispenser and sanitising gel, the IPC Cleaning Point ensures effective hygiene in public buildings outside the toilette areas reserved for personal hygiene.

The IPC Cleaning Point can be customised with user communications that include the name of the sanitisation company to draw the attention of the public to the need for proper hygiene and cleanliness.

Dispenser in HDS antibacterial plastic

Thanks to continuous research, IPC Euromop has been able to develop one of the most advanced technical materials in the field. IPC Euromop's HDS antibacterial plastic drastically reduces the bacterial load on surfaces and limits bacterial proliferation through direct and cross contamination.

The development of this anti-bacterially treated plastic has enabled a suite of antibacterial products to be produced for use in environments where hygiene is fundamental, such as hospitals and schools, the transport industry and public buildings in general.

IPC Euromop's HDS plastic is the first material of its kind, and the only one to obtain certification to ISO 22196:2007 standard (Plastics – Measurement of antibacterial activity on plastic surfaces).

Amuchina gel

IPC recommends Amuchina gel, the leading hand sanitising gel.

Amuchina gel's special formula ensures effective hand sanitisation and exercises an advanced bactericidal and dermo-protective function.

Amuchina gel helps eliminate the bacteria and germs typically transmitted through contact with money and other frequently handled objects and surfaces. Amuchina gel sanitises and protects the skin and maintains its natural pH and mono-lipidic balance thanks to carefully selected and accurately dosed moisturising ingredients.
